

Run GDS WinBidPro v15 on your Mac!

If you have a newer Mac with an Intel processor, you can easily run our GDS software. Keep in mind, you will need a licensed copy of Microsoft Windows XP or newer to install on your Mac. You have a few options to get this done.

1. The latest Apple Mac Leopard Operating System (OS) comes with a program called "Boot Camp". This is a program that allows you to boot up your Mac with either the Mac OS, or a Windows OS. Keep in mind, it is one or the other.
2. VMWare (vmware.com) makes a program called Fusion that runs in your Mac OS, and allows you to create Virtual Machines with different operating systems like Windows, Linux, and Unix. The software lets you run Windows like you run any other program on your Mac. As a bonus, you can make Windows full screen, keep it as an application window, or even merge the Windows desktop with your Mac desktop.
3. Parallels Desktop (parallels.com) works the same as Fusion. You can load a variety of operating systems on your Mac, and run them as a separate window, or at full screen.

The beauty of Fusion and Parallels is that you can quickly switch back and forth between your Mac desktop and your Windows desktop with a simple mouse click. This "virtual machine" technology sounds a lot more complicated than it really is. If you have a Mac and want to run our estimating software, this is a great way to do it.
